## Chapter 1 Description

This manual provides detailed instructions for setting up and using the RT234-OCR fixed mount barcode scanner (hereinafter referred to as "the RT234-OCR" or "the scanner").

| Chapter 1, Getting Started | Gives a general description of the RT234-OCR. |
| :--- | :--- |
| Chapter 2, System Settings | Introduces three configuration methods and describes how to configure <br> general parameters of the RT234-OCR. |
| Chapter 3, RS-232 Interface | Describes how to configure RS-232 communication parameters. |
| Chapter 4, USB Interface | Describes how to configure USB communication parameters. |
| Chapter 5, Symbologies | Lists all compatible symbologies and describes how to configure the <br> relevant parameters. |
| Chapter 6, Data Formatter | Explains how to customize scanned data with the advanced data formatter. |
| Chapter 7, Prefix \& Suffix | Describes how to use prefix and suffix to customize scanned data. |
| Chapter 8, Batch Programming | Explains how to integrate a complex programming task into a single barcode. |
| Appendix | Provides factory defaults table and a bunch of frequently used programming <br> barcodes. |

## Explanation of Icons

This icon indicates something relevant to this manual.

This icon indicates this information requires extra attention from the reader.

This icon indicates handy tips that can help you use or configure the scanner with ease.

Tasuple
This icon indicates practical examples that can help you to acquaint yourself with operations.

## Introduction

## RT234-OCR Scanner

## Data Port Pinout

| PIN | Signal | Type | Function |
| :---: | :---: | :---: | :---: |
| 1 | NC | - | NC |
| 2 | nTrig | I | Trigger input: normal 3.3V, pull low to 0V @ trigger |
| 3 | VCC | P | Power+ (DC5V) |
| 4 | TXD | 0 | RS-232 output |
| 5 | RXD | I | RS-232 input |
| 6 | CTS | I/O | Clear to send (RS-232) |
| 7 | RTS | I/O | Request to send (RS-232) |
| 8 | GND | P | Ground |
| 9 | D- | I/O | USB signal |
| 10 | D+ | I/O |  |

## Dimensions (unit: mm)

## IR Triggering Range

## Optics

Horizontal FOV:

Vertical FOV:

## Connecting the RT234-OCR to a Host Device

The scanner must be connected to a host device in actual application, such as PC, POS or any intelligent terminal with USB or RS-232 port, using a USB or RS-232 cable.

## USB

USB port on the host device

RS-232

RS-232 port on the host device

Note: Please check the port on the host device and purchase the cable accordingly.

## Using USB Cable

Connect the scanner to a host device with a USB cable with RJ45 and USB connectors:

1. Plug the cable's RJ45 connector into the data port on the scanner.
2. Plug the cable's USB connector into the USB port on the host device.

## Using RS-232 Cable

Connect the scanner to a host device with an RS-232 cable with RJ45, RS-232 connector and a power jack:

1. Plug the cable's RJ45 connector into the data port on the scanner.
2. Plug the cable's RS- 232 connector into the RS- 232 port on the host device.
3. Plug the power adapter into the power jack of the cable.
4. Connect the power adapter to a power outlet.

## Scanning Instructions

1. Position the barcode on mobile phone screen or paper in the center of the scan window.
2. For a successful read, the scanner will send the data to the host with its green Good Read LED flashing once.

## Maintenance

$\diamond \quad$ The scan window should be kept clean.
$\triangleleft \quad$ Do not scratch the scan window.
$\diamond \quad$ Use soft brush to remove the stain from the scan window.
$\diamond \quad$ Use the soft cloth to clean the window, such as eyeglass cleaning cloth.
$\triangleleft \quad$ Do not spray any liquid on the scan window.
$\diamond \quad$ Do not use any detergent to clean other parts of the device except for water.

Note: The warranty DOES NOT cover damages caused by inappropriate care and maintenance.

## Chapter 2 System Settings

## Introduction

There are two ways to configure the RT234-OCR: Barcode programming, command programming.

## Barcode Programming

The RT234-OCR can be configured by scanning programming barcodes. All user programmable features/options are described along with their programming barcodes/commands in the following sections.

This programming method is most straightforward. However, it requires manually scanning barcodes. As a result, errors are more likely to occur.

## Command Programming

The RT234-OCR can also be configured by serial commands sent from the host device

Users can design an application program to send those command strings to the scanners to perform device configuration. For more information, refer to the Serial Programming Command Manual.

## Programming Barcode/ Programming Command/Function

The figure above is an example that shows you the programming barcode and command for the Enter Setup function:

1. The No Case Conversion barcode.
2. The No Case Conversion command.
3. The description of feature/option.
4. ** indicates factory default settings.
** Exit Setup

## Use of Programming Command

Besides the barcode programming method, the scanner can also be configured by serial commands (HEX) sent from the host device. All commands must be entered in uppercase letters.

## Command Syntax

Prefix StorageType Tag SubTag \{Data\} [,SubTag \{Data\}] [;Tag SubTag \{Data\}] [...] Suffix

Prefix: "~<SOH>0000" (HEX: 7E 01303030 30), 6 characters.
StorageType: "@" (HEX: 40) or "\#" (HEX: 23), 1 character. "@" means permanent setting which will not be lost by removing power from the scanner or rebooting it; "\#" means temporary setting which will be lost by removing power from the scanner or rebooting it.

Tag: A 3-character case-sensitive field that identifies the desired command group. For example, all USB HID-KBW configuration settings are identified with a Tag of KBW.

SubTag: A 3-character case-sensitive field that identifies the desired parameter within the tag group. For example, the SubTag for the keyboard layout is CTY.

Data: The value for a feature or parameter setting, identified by the Tag and SubTag.
Suffix: ";<ETX>" (HEX: 3B 03), 2 characters.
Multiple commands can be issued within one Prefix/Suffix sequence. For configuration commands, only the Tag, SubTag, and Data fields must be repeated for each command in sequence. If an additional command is to be applied to the same Tag, then the command is separated with a comma (,) and only the SubTag and Data fields of the additional commands are issued. If the additional command requires a different Tag field, the command is separated from previous command by a semicolon (;).

## Query Commands

For query commands, the entry in the Data field in the syntax above is one of the following characters means:

* (HEX: 2A) What is the scanner's current value for the setting(s).
\& (HEX: 26) What is the factory default value for the setting(s).
${ }^{\wedge}$ (HEX: 5E) What is the range of possible values for the setting(s).

The value of the StoreType field in a query command can be either "@" (HEX: 40) or "\#" (HEX: 23).

A query command with the SubTag field omitted means to query all the settings concerning a tag. For example, to query all the current settings about Code 11, you should enter 7E 0130303030404331 31 2A 3B 03 (i.e. ~<SOH>0000@C11*;<ETX>).

## Responses

Different from command sequence, the prefix of a response consists of the six characters of "<STX><SOH>0000" (HEX: 020130303030 ).

The scanner responds to serial commands with one of the following three responses:
<ACK> (HEX: 06) Indicates a good command which has been processed.
<NAK> (HEX: 15) Indicates a good configuration command with its Data field entry out of the allowable range for this Tag and SubTag combination (e.g. an entry for an inter-keystroke delay of 100 when the field will only allow 2 digits), or an invalid query command.
<ENQ> (HEX: 05) Indicates an invalid Tag or SubTag command.

When responding, the scanner echoes back the command sequence with the status character above inserted directly before each of the punctuation marks (the comma or semicolon) in the command.

## Examples

Example 1: Enable Code 11, set the minimum and maximum lengths to 12 and 22 respectively.

Enter: 7E 01303030304043313145 4E 41 31 2C 4D 49 4E 3132 2C 4D 41583232 3B 03
( $\sim$ SOH $>0000 @$ C11ENA1,MIN12,MAX22;<ETX>)

Response: 0201303030304043313145 4E 413106 2C 4D 494 E 313206 2C 4D 4158323206 3B 03
(<STX><SOH>0000@C11ENA1<ACK>,MIN12<ACK>,MAX22<ACK>;<ETX>)

Example 2: Query the current minimum and maximum lengths of Code 11.
Enter: $\quad$ 7E 0130303030404331 31 4D 49 4E 2A 2C 4D 41 58 2A 3B 03 ( $\sim<$ SOH $>0000 @ C 11$ MIN* $^{*}$, MAX* $^{*}$; $<$ ETX $>$ )

Response: 02013030303040433131 4D 49 4E 313206 2C 4D 4158323206 3B 03
(<STX><SOH>0000@C11MIN12<ACK>,MAX22<ACK>;<ETX>)

Enter Setup

## Use of Programming Barcodes

Scanning the Enter Setup barcode can enable the scanner to enter the setup mode. Then you can scan a number of programming barcodes to configure your scanner. To exit the setup mode, scan the Exit Setup barcode or a non- programing barcode, or reboot the scanner.

Enter Setup

Programming barcode data (i.e. the characters under programming barcode) can be transmitted to the host device. Scan the appropriate barcode below to enable or disable the transmission of programming barcode data to the host device.

** Do Not Transmit Programming Barcode Data

Transmit Programming Barcode Data
** Exit Setup

## Illumination

A couple of illumination options are provided to improve the lighting conditions during every image capture:
Normal: Illumination LEDs are turned on during image capture.
Always On: Illumination LEDs keep on after the scanner is powered on.
Off: Illumination LEDs are off all the time.
Fade Up: Illumination LEDs are dimly lit when in standby mode and gradually increase their brightness during image capture.

Enter Setup

## Aiming

When scanning/capturing image, the scanner projects an aiming pattern which allows positioning the target barcode within its field of view and thus makes decoding easier.

Normal: The scanner projects an aiming pattern only during barcode scanning/capture.
Always On: Aiming pattern is constantly on after the scanner is powered on.
Off: Aiming pattern is off all the time.

## Good Read LED

The green LED can be programmed to be On or Off to indicate good read.

Enter Setup

## Good Read LED Duration

This parameter sets the amount of time that the Good Read LED to remain on following a good read. It is programmable in 1 ms increments from 1 ms to $2,500 \mathrm{~ms}$.

Medium (120ms)

Custom (1-2,500ms)

Set the Good Read LED duration to 800 ms :

1. Scan the Enter Setup barcode.
2. Scan the Custom barcode.
3. Scan the numeric barcodes " 8 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Power On Beep

The scanner can be programmed to beep when it is powered on. Scan the $\mathbf{O f f}$ barcode if you do not want a power on beep.

## Good Read Beep

Scanning the Off barcode can turn off the beep that indicate successful decode; scanning the On barcode can turn it back on.

## Good Read Beep Duration

This parameter sets the length of the beep the scanner emits on a good read. It is programmable in 1 ms increments from 20 ms to 300 ms .

Set the Good Read Beep duration to 200ms:

1. Scan the Enter Setup barcode.
2. Scan the Custom barcode.
3. Scan the numeric barcodes " 2 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Good Read Beep Frequency

This parameter is programmable in 1 Hz increments from 20 Hz to $20,000 \mathrm{~Hz}$.

Set the Good Read Beep frequency to $\mathbf{2 , 0 0 0 H z}$ :

1. Scan the Enter Setup barcode.
2. Scan the Custom barcode.
3. Scan the numeric barcodes " 2 ", " 0 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Good Read Beep Volume

Medium

## Scan Mode

- Manual Trigger Mode: A trigger pull activates a decode session. The decode session continues until a barcode is decoded or you release the trigger.
- Sense Mode: The scanner waits for the image stabilization timeout to expire before activating a decode session eagtime it detects a change in ambient illumination. Decode session continues until a barcode is decoded or the decode session timeout expires. In this mode, a trigger pull can also activate a decode session. The decode session continues until a barcode is decoded or the trigger is released. When the session ends, the scanner continues to monitor ambient illumination.Timeout between Decodes (Same Barcode) can avoid undesired rereading of same barcode in a given period of time. Sensitivity can change the Sense Mode's sensibility to changes in ambientillumination.
- Continuous Mode: The scanner automatically starts one decode session after another. To suspend/resume barcode reading, simply press the trigger. Timeout between Decodes (Same Barcode) can avoid undesired rereading of same barcode in a given period of time.
- Pulse Mode: When the trigger is pulled and released, scanning is activated until a barcode is decoded or the decodesession timeout expires (The decode session timeout begins when the trigger is released).

** Sense Mode

Continuous Mode

## Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 1 ms increments from 1 ms to $3,600,000 \mathrm{~ms}$. When it is set to 0 , the timeout is infinite. The default setting is $3,000 \mathrm{~ms}$.

## Set the decode session timeout to $\mathbf{1 , 5 0 0 m s}$ :

1. Scan the Enter Setup barcode.
2. Scan the Decode Session Timeout barcode.
3. Scan the numeric barcodes " 1 ", " 5 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Image Stabilization Timeout (Sense Mode)

This parameter defines the amount of time that the scanner waits for the image to stabilize to a point that it can be decoded with more accuracy. It is programmable in 1 ms increments from 0 ms to $3,000 \mathrm{~ms}$. The default setting is 200 ms .

Image Stabilization Timeout

## Set the image stabilization timeout to 800 ms :

1. Scan the Enter Setup barcode.
2. Scan the Image Stabilization Timeout barcode.
3. Scan the numeric barcodes " 8 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Timeout between Decodes (Same Barcode)

Timeout between Decodes (Same Barcode) can avoid undesired rereading of same barcode in a given period of time. This feature is only applicable to the Sense and Continuous modes.

To enable/disable the Timeout between Decodes (Same Barcode), scan the appropriate barcode below.
Enable Timeout between Decodes (Same Barcode): Do not allow the scanner to re-read same barcode before the timeout between decodes (same barcode) expires.

Disable Timeout between Decodes (Same Barcode): Allow the scanner to re-read same barcode.

Enable Timeout between Decodes (Same Barcode)

** Disable Timeout between Decodes (Same Barcode)

The following parameter sets the timeout between decodes for same barcode. It is programmable in 1 ms increments from 0 ms to $3,600,000 \mathrm{~ms}$. When it is set to a value greater than 3,000 , the timeout for rereading same programming barcode is limited to $3,000 \mathrm{~ms}$. The default setting is $1,500 \mathrm{~ms}$.

## Timeout between Decodes (Same Barcode)

Set the timeout between decodes (same barcode) to $\mathbf{1 , 0 0 0} \mathbf{m s}$ :

1. Scan the Enter Setup barcode.
2. Scan the Timeout between Decodes (Same Barcode) barcode.
3. Scan the numeric barcodes " 1 ", " 0 ", " 0 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.

5 Scan the Exit Setun barcode

Enter Setup

## Sensitivity (Sense Mode)

Sensitivity specifies the degree of acuteness of the scanner's response to changes in ambient illumination. The higher the sensitivity, the lower requirement in illumination change to trigger the scanner. You can select an appropriate degree of sensitivity that fits the ambient environment. The feature is only applicable to the Sense mode.

Set the sensitivity to Level 10:

1. Scan the Enter Setup barcode.
2. Scan the Custom Sensitivity barcode.
3. Scan the numeric barcodes " 1 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Trigger Commands

When Enable Trigger Commands is selected, you can activate and deactivate the scanner in the Level mode with serial trigger commands. Sending the Start Scanning command (default: <SOH> T <EOT>, user-programmable) to the scanner in the Level mode activates a decode session. The decode session continues until a barcode is decoded or the decode session timeout expires or the scanner receives the Stop Scanning command (default: <SOH>P <EOT>, user- programmable).

** Disable Trigger Commands

Enable Trigger Commands

## Modify Start Scanning Command

The Start Scanning command can consist of 1-10 characters (HEX values from $0 x 01$ to $0 x F F$ ). In this command, the character "?" (HEX: 0x3F) cannot be the first character. The default Start Scanning command is <SOH> T <EOT>.

Modify Start Scanning Command

Set the Start Scanning command to "*T":

1. Scan the Enter Setup barcode.
2. Scan the Modify Start Scanning Command barcode.
3. Scan the numeric barcodes " 2 ", " $A$ ", " 5 " and " 4 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Modify Stop Scanning Command

The Stop Scanning command can consist of 1-10 characters (HEX values from $0 \times 01$ to $0 x F F$ ). In this command, the character "?" (HEX: 0x3F) cannot be the first character. The default Stop Scanning command is <SOH>P <EOT>.

## Set the Stop Scanning command to "*P":

1. Scan the Enter Setup barcode.
2. Scan the Modify Stop Scanning Command barcode.
3. Scan the numeric barcodes " 2 ", " $A$ ", " 5 " and " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Scanning Preference

Normal Mode: Select this mode when reading barcodes on paper.
Screen Mode: Select this mode when reading barcodes on the screen.

## Decode Area

$\sim$ Whole Area Decoding: The scanner attempts to decode barcode(s) within its field of view, from the center to $\mathbf{b}$ periphery, and transmits the barcode that has been first decoded.
$\checkmark$ Specific Area Decoding: The scanner attempts to read barcode(s) within a specified decoding area and transmits the barcode that has been first decoded. This option allows the scanner to narrow its field of view to make sure it reads only those barcodes intended by the user. For instance, if multiple barcodes are placed closely together, specific area decoding in conjunction with appropriate pre-defined decoding area will insure that only the desired barcode is read.

** Whole Area Decoding

Specific Area Decoding

Enter Setup

If Specific Area Decoding is enabled, the scanner only reads barcodes that intersect the predefined decoding area.

The default decoding area is an area of $40 \%$ top, $60 \%$ bottom, $40 \%$ left and $60 \%$ right of the scanner's field of view
You can define the decoding area using the Top of Decoding Area, Bottom of Decoding Area, Left of Decoding Area and Right of Decoding Area barcodes as well as numeric barcode(s) that represent(s) a desired percentage (0-100). The value of Bottom must be greater than that of Top; the value of Right must be greater than that of Left.

Bottom of Decoding Area

Left of Decoding Area

Program the scanner to only read Barcode 1 in the figure above by setting the decoding area to $\mathbf{1 0 \%}$ top, $\mathbf{4 5 \%}$ bottom, $\mathbf{1 5 \%}$ left and 30\% right:

1. Scan the Enter Setup barcode.
2. Scan the Top of Decoding Area barcode.
3. Scan the numeric barcode " 0 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Bottom of Decoding Area barcode.
6. Scan the numeric barcodes " 4 " and " 5 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Top of Decoding Area barcode.
9. Scan the numeric barcodes " 1 " and " 0 " from the "Digit Barcodes" section in Appendix.
10. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
11. Scan the Left of Decoding Area barcode.
12. Scan the numeric barcode " 0 " from the "Digit Barcodes" section in Appendix.
13. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
14. Scan the Right of Decoding Area barcode.
15. Scan the numeric barcodes " 3 " and " 0 " from the "Digit Barcodes" section in Appendix.
16. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
17. Scan the Left of Decoding Area barcode.
18. Scan the numeric barcodes " 1 " and " 5 " from the "Digit Barcodes" section in Appendix.
19. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
20. Scan the Exit Setup barcode.

## Image Flipping

Flip Horizontally

Flip Horizontally \& Vertically

Example of image not flipped

Example of image flipped vertically

Example of image flipped horizontally

Example of image flipped horizontally \& vertically

## Bad Read Message

Scan the appropriate barcode below to select whether or not to send a bad read message (user-programmable) when a good read does not occur before trigger release, or the decode session timeout expires, or the scanner receives the Stop Scanning command (For more information, see the "Serial Trigger Command" section in this Chapter).

## Set Bad Read Message

A bad read message can contain up to 7 characters (HEX values from 0x00 to 0xFF). To set a bad read message, scan the Set Bad Read Message barcode, the numeric barcodes representing the hexadecimal values of desired character(s) and the Save barcode. The default setting is " NG ".

Set Bad Read Message

Set the bad read message to " $F$ " (HEX: 0x46):

1. Scan the Enter Setup barcode.
2. Scan the Set Bad Read Message barcode.
3. Scan the numeric barcodes " 4 " and " 6 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Exit Setup barcode.

## Default Settings

## Factory Defaults

Scanning the following barcode can restore the scanner to the factory defaults.
You may need to reset all parameters to the factory defaults when:
$\leadsto$ scanner is not properly configured so that it fails to decode barcodes.
$\checkmark$ you forget previous configuration and want to avoid its impact.

Restore All Factory Defaults

## Custom Defaults

Scanning the Restore All Custom Defaults barcode can reset all parameters to the custom defaults. Scanning the Save as
Custom Defaults barcode can set the current settings as custom defaults.
Custom defaults are stored in the non-volatile memory.

Save as Custom Defaults

Restore All Custom Defaults

Restoring the scanner to the factory defaults will not remove the custom defaults from the scanner.

## Query Product Information

After scanning the barcode below, the product information (including product name, firmware version, decoder version, hardware version, serial number, OEM serial number and manufacturing date) will be sent to the host device.

** Exit Setup

Enter Setup

## Chapter 3 RS-232 Interface

## Introduction

When the scanner is connected to the RS-232 port of a host device, the scanner will automatically enable RS-232 communication. However, you need to set communication parameters (including baud rate, parity check, data bit and stop bit) on the scanner to match the host device so that two devices can communicate with each other

## Baud Rate

Baud rate is the number of bits of data transmitted per second. Set the baud rate to match the host requirements.

** Exit Setup

## Parity Check

Set the parity type to match the host requirements.

- Odd Parity: If the data contains an odd number of 1 bits, the parity bit value is set to 0 .
- Even Parity: If the data contains an even number of 1 bits, the parity bit value is set to 0 .
- None: Select this option when no parity bit is required.

Even Parity

## Data Bit

Set the number of data bits to match the host requirements.

## Stop Bit

The stop bit(s) at the end of each transmitted character marks the end of transmission of one character and prepares the receiving device for the next character in the serial data stream. Set the number of stop bits to match the host requirements.

2 Stop Bits

## Hardware Auto Flow Control

If this feature is enabled, the scanner determines whether to transmit data based on CTS signal level. When CTS signal is at a low level which means the serial port's cache memory of receiving device (such as PC) is full, the scanner sends data through RS-232 port until CTS signal is set to high level by receiving device. When the scanner is not ready for receiving, it will set RTS signal to low level. When sending device (such as PC) detects it, it will not send data to the scanner any more to prevent data loss.

If this feature is disabled, reception/transmission of serial data will not be influenced by RTS/CTS signal.

** Disable Hardware Auto Flow Control

Enable Hardware Auto Flow Control

Before enabling this feature, make sure that RTS/CTS signal lines are contained in RS-232 cable. Without the signal lines, RS-232 communication errors will occur.

## Chapter 4 USB Interface

## Introduction

There are four options for USB connection:

■ USB HID Keyboard: The scanner's transmission is simulated as USB keyboard input with no need for command configuration or a driver. Barcode data could be entered by the virtual keyboard directly and it is also convenient for the host device to receive data.

■ USB Virtual Com: It is compliant with the standard USB CDC class specifications defined by the USB-IF and allows the host device to receive data in the way as a serial port does. A driver is needed when using this feature.

- HID POS (POS HID Barcode Scanner): It is based on the HID interface, with no need for a custom driver. It exd virtual keyboard and traditional RS-232 interface in transmission speed.

■ IBM SurePOS: It conforms to IBM (now Toshiba Global Commerce Solutions) 4698 USB scanner interface specifications.

When the scanner is connected to both USB and RS-232 ports on a host device, it will select the USB connection by default.

## USB HID Keyboard

When the scanner is connected to the USB port on a host device, you can enable the USB HID Keyboard feature by scanning the barcode below. Then scanner's transmission will be simulated as USB keyboard input. The Host receives keystrokes on the virtual keyboard. It works on a Plug and Play basis and no driver is required.

USB HID Keyboard

If the host device allows keyboard input, then no extra software is needed for HID Keyboard input.

## USB Country Keyboard Types

Keyboard layouts vary from country to country. The default setting is U.S. keyboard.

** Exit Setup

## Beep on Unknown Character

Due to the differences in keyboard layouts, some characters contained in barcode data may be unavailable on the selected keyboard. As a result, the scanner fails to transmit the unknown characters.

Scan the appropriate barcode below to enable or disable the emission of beep when an unknown character is detected.

** Do Not Beep on Unknown Character

Beep on Unknown Character

Supposing French keyboard (Country Code: 7) is selected and barcode data "AĐF" is beingdealted with, the keyboard will fail to locate the "Đ" ( $0 x D 0$ ) character and the scanner will ignore the character and continue to process the next one.

Do Not Beep on Unknown Character: The scanner does not beep and the Host receives "AF".

Beep on Unknown Character: The scanner beeps and the Host still receives "AF".

If Emulate ALT+Keypad ON is selected, Beep on Unknown Character does not function.

## Emulate ALT+Keypad

When Emulate ALT+Keypad is turned on, any character is sent over the numeric keypad no matter which keyboard type is selected.

1. ALT Make
2. Enter the number corresponding to a desired character on the keypad.
3. ALT Break

After Emulate ALT+Keypad ON is selected, you need to choose the code page with which the barcodes were created and to turn Unicode Encoding On or Off depending on the encoding used by the application software.

Any character can be sent in the ALT+Keypad way. However, since sending a character involves multiple keystroke emulations, this method appears less efficient.

Supposing Emulate ALT+Keypad is ON, Unicode Encoding is Off, and Code Page 1252 (Latin, Western
European) is selected, barcode data "AÐF" (65/208/70) is sent as below:

$$
\begin{aligned}
& \text { "A" - "ALT Make" + "065" + "ALT Break" } \\
& \text { "Đ" -- "ALT Make" + "208" + "ALT Break" } \\
& \text { "F" -- "ALT Make" + "070" + "ALT Break" }
\end{aligned}
$$

## Code Page

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characteris, it may be because the barcode being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, select the code page with which the barcodes were created by scanning the appropriate barcode below. For PDF417, QR Code, Aztec and Data Matrix, besides setting the code page, you also need to set the character encoding in the "Character Encoding" section in Chapter 6. This feature is only effective when Emulate ALT+Keypad is turned on.

** Code Page 1252 (Latin, Western European)

Code Page 936 (Simplified Chinese, GB2312,GBK)

Code Page 950 (Traditional Chinese, Big5)

## Unicode Encoding

Different host program may use different character encodings for handling incoming barcode data. For instance, Microsoft Office Word uses Unicode encoding and therefore you should turn Unicode Encoding on, whereas Microsoft Office Excel or Notepad uses Code Page encoding and therefore you should turn Unicode Encoding off. This feature is only effective when Emulate ALT+Keypad is turned on.

On

## Function Key Mapping

When Function Key Mapping is enabled, function character ( $0 \mathrm{x} 00-0 \mathrm{x} 1 \mathrm{~F}$ ) are sent as ASCII sequences over the numeric keypad.

1. CTRL Make
2. Press function key
3. CTRL Break

** Disable Function Key Mapping

Enable Function Key Mapping

Supposing the Function Key Mapping feature is enabled and other parameters of USB HID Keyboard adopt factory defaults, barcode data "A<HT>(i.e. Horizontal Tab)F" (0x41/0x09/0x46) is sent as below:

1. "A" - Keystroke "A".
2. "Ctrl I" - "Ctrl Make" + Keystroke "I" + "Ctrl Break"
3. "F" - Keystroke "F"

For some text editors, "Ctrl I" means italic convert. So the output may be "AF".

Emulate ALT+Keypad ON prevails over Enable Function Key Mapping.

## ASCII Function Key Mapping Table

| ASCII Function | ASCII Value (HEX) | No Function Key Mapping | Function Key Mapping |
| :---: | :---: | :---: | :---: |
| NUL | 00 | Null | Ctrl+2 |
| SOH | 01 | Keypad Enter | Ctrl+A |
| STX | 02 | Caps Lock | Ctrl+B |
| ETX | 03 | Null | Ctrl+C |
| EOT | 04 | Null | Ctrl+D |
| ENQ | 05 | Null | Ctrl+E |
| ACK | 06 | Null | Ctrl+F |
| BEL | 07 | Enter | Ctrl+G |
| BS | 08 | Left Arrow | $\mathrm{Ctrl}+\mathrm{H}$ |
| HT | 09 | Horizontal Tab | Ctrl+I |
| LF | 0A | Down Arrow | Ctrl+J |
| VT | 0B | Vertical Tab | Ctrl+K |
| FF | OC | Delete | Ctrl+L |
| CR | 0D | Enter | Ctrl+M |
| SO | 0E | Insert | $\mathrm{Ctrl}+\mathrm{N}$ |
| SI | 0F | Esc | Ctrl+0 |
| DLE | 10 | F11 | Ctrl+P |
| DC1 | 11 | Home | Ctrl+Q |
| DC2 | 12 | PrintScreen | Ctrl+R |
| DC3 | 13 | Backspace | Ctrl+S |
| DC4 | 14 | tab+shift | Ctrl+T |
| NAK | 15 | F12 | Ctrl +U |
| SYN | 16 | F1 | Ctrl+V |
| ETB | 17 | F2 | Ctrl+W |
| CAN | 18 | F3 | Ctrl+X |
| EM | 19 | F4 | Ctrl+Y |
| SUB | 1A | F5 | Ctrl+Z |
| ESC | 11 | F6 | Ctrl+[ |
| FS | 1C | F7 | Ctrl+ \( |
| ) |  |  |  |
| GS | 1D | F8 | Ctrl+] |
| RS | 1E | F9 | Ctrl+6 |
| US | 1F | F10 | Ctrl+- |

## ASCII Function Key Mapping Table (Continued)

The last five characters ( $0 \mathrm{x} 1 \mathrm{~B} \sim 0 \mathrm{x} 1 \mathrm{~F}$ ) in the table above apply to US keyboard layout only. The following chart provides the equivalents of these five characters for other countries.

| Country | Code |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| United States | [ | 1 | ] | 6 | - |  |
| Belgium | [ | < | ] | 6 | - |  |
| Scandinavia | 8 | $<$ | 9 | 6 | - |  |
| France | $\wedge$ | 8 | \$ | 6 | = |  |
| Germany |  | Ã | + | 6 | - |  |
| Italy |  | $\backslash$ | + | 6 | - |  |
| Switzerland |  | $<$ | . | 6 | - |  |
| United Kingdom | [ | $\not \subset$ | ] | 6 | - |  |
| Denmark | 8 | 1 | 9 | 6 | - |  |
| Norway | 8 | $\backslash$ | 9 | 6 | - |  |
| Spain | [ | 1 | ] | 6 | - |  |

## Inter-Keystroke Delay

This parameter specifies the delay between emulated keystrokes.

## Caps Lock

The Caps Lock ON option can invert upper and lower case characters contained in barcode data. This inversion occurs regardless of the state of Caps Lock key on the host device's keyboard.

Emulate ALT+Keypad ON/ Convert All to Upper Case/ Convert All to Lower Case prevails over Caps Lock ON.
$\mathrm{F}_{\text {uple }}$
When the Caps Lock ON feature is selected, barcode data " AbC " is transmitted as "aBc".

## Convert Case

Scan the appropriate barcode below to convert all bar code data to your desired case.

When the Convert All to Lower Case feature is enabled, barcode data " AbC " is transmitted as "abc".

If Emulate ALT+Keypad ON is selected, Convert All to Lower Case and Convert All to Upper Case do not function.

## Emulate Numeric Keypad

- Do Not Emulate Numeric Keypad 1: Sending a number (0-9) is emulated as keystroke(s) on main keyboard.
- Emulate Numeric Keypad 1: Sending a number (0-9) is emulated as keystroke(s) on numeric keypad. The state of Num Lock on the simulated numeric keypad is determined by its equivalent on the host device. If Num Lock on the host device is turned off, the output of simulated numeric keypad is function key instead of number.
- Do Not Emulate Numeric Keypad 2: Sending " + ", "一", "*" and "/" is emulated as keystroke(s) on main keyboard.
- Emulate Numeric Keypad 2: Sending "+", "-", "*" and "/" is emulated as keystroke(s) on numeric keypad.

[^0]

Emulate Numeric Keypad 1

## ** Do Not Emulate Numeric Keypad 2

Emulate Numeric Keypad 2

Emulate ALT+Keypad ON prevails over Emulate Numeric Keypad.
$\mathbf{F}_{\text {mple }}$
Supposing the Emulate Numeric Keypad feature is enabled:
if Num Lock on the host device is ON, "A4.5" is transmitted as "A4.5";
if Num Lock on the host device is OFF, "A4.5" is transmitted as follows:

1. " $A$ " is sent as is because it is not included in numeric keypad;
2. " 4 " is sent as the function key "Cursor Move to Left";
3. "." is sent as the function key "Delete After the Cursor";
4. " 5 " is not sent as it does not correspond to any function key.

Fast Mode

When Fast Mode On is selected, the scanner sends characters to the Host faster. If the Host drops characters, turn the Fast Mode off or change the polling rate to a bigger value.

@KBWFAS1
Fast Mode On

## Polling Rate

This parameter specifies the polling rate for a USB keyboard. If the Host drops characters, change the polling rate to a bigger value.

##  <br> @KBWPOR0 <br> 1ms

6ms

7 ms

9ms

## USB Virtual Com

If your scanner is connected to the USB port on a host device, the USB Virtual Com feature allows the host device to receive data in the way as a serial port does. The scanner will install the driver automatically.

## HID POS (POS HID Barcode Scanner)

## Introduction

The HID-POS interface is recommended for new application programs. It can send up to 56 characters in a single USB report and appears more efficient than keyboard emulation.

Features:

- HID based, no custom driver required.

■ Way more efficient in communication than keyboard emulation and traditional RS-232 interface.

## Access the Scanner with Your Program

Use CreateFile to access the scanner as a HID device and then use ReadFile to deliver the scanned data to the application program. Use WriteFile to send data to the scanner.

For detailed information about USB and HID interfaces, go to www.USB.org.

## Acquire Scanned Data

After a barcode is decoded, the scanner sends an input report as below:

|  | Bit |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | Report ID $=0 \times 02$ |  |  |  |  |  |  |  |
| 1 | Barcode Length |  |  |  |  |  |  |  |
| 2-57 | Decoded Data (1-56) |  |  |  |  |  |  |  |
| 58-61 | Reserved |  |  |  |  |  |  |  |
| 62 | Symbology Identifier or N/C: 0x00 |  |  |  |  |  |  |  |
| 63 | - | - | - | - | - | - | - | Decoded data continued |

## Send Command to the Scanner

This output report is used to send commands to the scanner. All programming commands can be used.

|  | Bit |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | Report ID $=0 \times 04$ |  |  |  |  |  |  |  |
| 1 | Length of command |  |  |  |  |  |  |  |
| $2-63$ | Command (1-62) |  |  |  |  |  |  |  |

## IBM SurePOS (Tabletop)

IBM SurePOS (Handheld)

IBM SurePOS (Handheld)

## Chapter 5 Symbologies

## Introduction

Every symbology (barcode type) has its own unique attributes. This chapter provides programming barcodes for configuring the scanner so that it can identify various symbologies. It is recommended to disable those that are rarely used to increase the efficiency of the scanner.

## Global Settings

## Enable/Disable All Symbologies

If the Disable All Symbologies feature is enabled, the scanner will not be able to read any non-programming barcodes except the programming barcodes.

Enable All Symbologies

Enable/Disable 1D Symbologies

Enable 1D Symbologies

** Exit Setup

Enable/Disable 2D Symbologies

## Enable Postal Symbologies

Enable All Postal Symbologies

## 1D Twin Code

1D twin code is two 1D barcodes of a symbology or of different symbologies paralleled vertically. Both barcodes must have similar specifications and be placed closely together.

There are 3 options for reading 1D twin code:

- Single 1D Code Only: Read either 1D code.
- Twin 1D Code Only: Read both 1D codes. Transmission sequence: upper 1D code followed by lower 1D code.

■ Both Single \& Twin: Read both 1D codes. If successful, transmit as twin 1D code only. Otherwise, try single 1D code only.

** Single 1D Code Only

Twin 1D Code Only

## Code 128

## Restore Factory Defaults

Restore the Factory Defaults of Code 128

Enable/Disable Code 128

Disable Code 128

If the scanner fails to identify Code 128 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Code 128 barcode.
** Exit Setup

## Set Length Range for Code 128

The scanner can be configured to only decode Code 128 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes Code 128 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 128 barcodes with that length are to be decoded.

Set the scanner to decode Code 128 barcodes containing between 8 and12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

EAN-8

## Restore Factory Defaults

Restore the Factory Defaults of EAN-8

Enable/Disable EAN-8

* Enable EAN-8

Disable EAN-8

If the scanner fails to identify EAN-8 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable EAN-8 barcode.

## Transmit Check Character

EAN-8 is 8 digits in length with the last one as its check character used to verify the integrity of the data.

** Transmit EAN-8 Check Character
** Exit Setup

## 2-Digit Add-On Code

An EAN-8 barcode can be augmented with a two-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is an EAN-8 barcode while the part circled by red dotted line is a two-digit add-on code.

[^1]

Enable 2-Digit Add-On Code

Disable 2-Digit Add-On Code: The scanner decodes EAN-8 and ignores the add-on code when presented with an EAN-8 plus 2-digit add-on barcode. It can also decode EAN-8 barcodes without 2-digit add-on codes. Enable 2-Digit Add-On Code: The scanner decodes a mix of EAN-8 barcodes with and without 2-digit addon codes.

Enter Setup

## 5-Digit Add-On Code

An EAN-8 barcode can be augmented with a five-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is an EAN-8 barcode while the part circled by red dotted line is a five-digit add-on code.

** Disable 5-Digit Add-On Code

Enable 5-Digit Add-On Code

Disable 5-Digit Add-On Code: The scanner decodes EAN-8 and ignores the add-on code when presented with an EAN-8 plus 5-digit add-on barcode. It can also decode EAN-8 barcodes without 5-digit add-on codes.
Enable 5-Digit Add-On Code: The scanner decodes a mix of EAN-8 barcodes with and without 5-digit addon codes.

## Convert EAN-8 to EAN-13

Convert EAN-8 to EAN-13: Convert EAN-8 decoded data to EAN-13 format before transmission. After conversion, the data follows EAN-13 format and is affected by EAN-13 programming selections (e.g., Check Character).

Do Not Convert EAN-8 to EAN-13: EAN-8 decoded data is transmitted as EAN-8 data, without conversion.

** Do Not Convert EAN-8 to EAN-13

Convert EAN-8 to EAN-13

## EAN-13

## Restore Factory Defaults

Restore the Factory Defaults of EAN-13

## Enable/Disable EAN-13

Disable EAN-13

If the scanner fails to identify EAN-13 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable EAN-13 barcode.

## Transmit Check Character

Do Not Transmit EAN-13 Check Character

## 2-Digit Add-On Code

An EAN-13 barcode can be augmented with a two-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is an EAN-13 barcode while the part circled by red dotted line is a two-digit add-on code.

** Disable 2-Digit Add-On Code

Enable 2-Digit Add-On Code

Disable 2-Digit Add-On Code: The scanner decodes EAN-13 and ignores the add-on code when presented with an EAN-13 plus 2-digit add-on barcode. It can also decode EAN-13 barcodes without 2- digit add-on codes.

Enable 2-Digit Add-On Code: The scanner decodes a mix of EAN-13 barcodes with and without 2-digit addon codes.
** Exit Setup

Enter Setup

## 5-Digit Add-On Code

An EAN-13 barcode can be augmented with a five-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is an EAN-13 barcode while the part circled by red dotted line is a five-digit add-on code.

** Disable 5-Digit Add-On Code

Enable 5-Digit Add-On Code

Disable 5-Digit Add-On Code: The scanner decodes EAN-13 and ignores the add-on code when presented with an EAN-13 plus 5-digit add-on barcode. It can also decode EAN-13 barcodes without 5- digit add-on codes.

Enable 5-Digit Add-On Code: The scanner decodes a mix of EAN-13 barcodes with and without 5-digit addon codes.

## UPC-E

## Restore Factory Defaults

Restore the Factory Defaults of UPC-E

Enable/Disable UPC-E

Disable UPC-E

If the scanner fails to identify UPC-E barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable UPC-E barcode.

## Transmit Check Character

UPC-E is 8 digits in length with the last one as its check character used to verify the integrity of the data.

** Transmit UPC-E Check Character

## 2-Digit Add-On Code

A UPC-E barcode can be augmented with a two-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is a UPC-E barcode while the part circled by red dotted line is a two-digit add-on code.

## 5-Digit Add-On Code

A UPC-E barcode can be augmented with a five-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is a UPC-E barcode while the part circled by red dotted line is a five-digit add-on code.

[^2]

Disable 5-Digit Add-On Code: The scanner decodes UPC-E and ignores the add-on code when presented with a UPC-E plus 5-digit add-on barcode. It can also decode UPC-E barcodes without 5-digit add-on codes.

Enable 5-Digit Add-On Code: The scanner decodes a mix of UPC-E barcodes with and without 5-digit add-on codes.

## Transmit Preamble Character

Preamble characters (Country Code and System Character) can be transmitted as part of a UPC-E barcode. Select one of the following options for transmitting UPC-E preamble to the host device: transmit system character only, transmit system character and country code (" 0 " for USA), or transmit no preamble.

No Preamble

System Character \& Country Code

## Convert UPC-E to UPC-A

Convert UPC-E to UPC-A: Convert UPC-E (zero suppressed) decoded data to UPC-A format before transmission. After conversion, the data follows UPC-A format and is affected by UPC-A programming selections (e.g., Preamble, Check Character).

Do Not Convert UPC-E to UPC-A: UPC-E decoded data is transmitted as UPC-E data, without conversion.

[^3]

UPC-A

## Restore Factory Defaults

Restore the Factory Defaults of UPC-A

## Enable/Disable UPC-A

If the scanner fails to identify UPC-A barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable UPC-A barcode.

## Transmit Check Character

UPC-A is 13 digits in length with the last one as its check character used to verify the integrity of the data.

** Transmit UPC-A Check Character

## 2-Digit Add-On Code

A UPC-A barcode can be augmented with a two-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is a UPC-A barcode while the part circled by red dotted line is a two-digit add-on code.

[^4]

Disable 2-Digit Add-On Code: The scanner decodes UPC-A and ignores the add-on code when presented with a UPC-A plus 2-digit add-on barcode. It can also decode UPC-A barcodes without 2-digit add-on codes. Enable 2-Digit Add-On Code: The scanner decodes a mix of UPC-A barcodes with and without 2-digit addon codes.

## 5-Digit Add-On Code

A UPC-A barcode can be augmented with a five-digit add-on code to form a new one. In the example below, the part surrounded by blue dotted line is a UPC-A barcode while the part circled by red dotted line is a five-digit add-on code.

** Disable 5-Digit Add-On Code

Disable 5-Digit Add-On Code: The scanner decodes UPC-A and ignores the add-on code when presented with a UPC-A plus 5-digit add-on barcode. It can also decode UPC-A barcodes without 5-digit add-on codes.

Enable 5-Digit Add-On Code: The scanner decodes a mix of UPC-A barcodes with and without 5-digit addon codes.

Transmit Preamble Character

Preamble characters (Country Code and System Character) can be transmitted as part of a UPC-A barcode. Select one of the followingoptions for transmitting UPC-A preamble to the host device: transmit system character only or transmit system character and country code (" 0 " for USA).

System Character

System Character \& Country Code

## Coupon

## UPC-A/EAN-13 with Extended Coupon Code

The following three types of coupon code + extended coupon code are supported:
■ UPC-A (starting with " 5 ") + GS1-128
■ UPC-A (starting with " 5 ") + GS1 Databar

- EAN-13 (starting with "99") + GS1-128

Use the appropriate barcode below to enable or disable UPC-A/EAN-13 with Extended Coupon Code. When left on the default setting (Off), the scanner treats Coupon Codes and Extended Coupon Codes as single bar codes.

If you scan the Allow Concatenation code, when the scanner sees the coupon code and the extended coupon code in a single scan, it transmits both as separate symbologies. Otherwise, it transmits the first coupon code it reads.

If you scan the Require Concatenation code, the scanner must see and read the coupon code and extended coupon code in a single read to transmit the data. No data is output unless both codes are read.

Allow Concatenation

Require Concatenation

When using the UPC-A Coupon feature, please ensure that System Character or System Character \&
Country Code is selected for the "Transmit UPC-A Preamble Character" feature.

## Coupon GS1 Databar Output

If you scan coupons that have both UPC and GS1 Databar codes, you may wish to scan and output only the data from the GS1 Databar code. Scan the GS1 Output On barcode below to scan and output only the GS1 Databar code data.

When GS1 Output Off is selected, coupons that have both UPC and GS1 Databar codes are transmitted depending on your selection for the "UPC-A/EAN-13 with Extended Coupon Code" feature.

When using the UPC-A Coupon feature, please ensure that System Character or System Character \& Country Code is selected for the "Transmit UPC-A Preamble Character" feature.

Interleaved 2 of 5

## Restore Factory Defaults

Restore the Factory Defaults of Interleaved 2 of 5

## Enable/Disable Interleaved 2 of 5

** Enable Interleaved 2 of 5

Disable Interleaved 2 of 5

If the scanner fails to identify Interleaved 2 of 5 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Interleaved 2 of 5 barcode.

## Set Length Range for Interleaved 2 of 5

The scanner can be configured to only decode Interleaved 2 of 5 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 6)

Set the Maximum Length (Default: 80)

If minimum length is set to be greater than maximum length, the scanner only decodes Interleaved 2 of 5 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Interleaved 2 of 5 barcodes with that length are to be decoded.

Set the scanner to decode Interleaved 2 of 5 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

A check character is optional for Interleaved 2 of 5 and can be added as the last character. It is a calculated value used to verify the integrity of the data.

- Disable: The scanner transmits Interleaved 2 of 5 barcodes as is.

■ Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Interleaved 2 of barcodes to verify that the data complies with the check character algorithm. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.

- Transmit Check Character After Verification: The scanner checks the integrity of all Interleaved 2 of 5 barcodes to verify that the data complies with the check character algorithm. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Since Interleaved 2 of 5 must always have an even number of digits, a zero may need to be added as the first digit when the check character is added. The check character is automatically generated when making Interleaved 2 of 5 barcodes.

#  <br> Do Not Transmit Check Character After Verification 

Transmit Check Character After Verification

If the Do Not Transmit Check Character After Verification option is enabled, Interleaved 2 of 5 barcodes
 with a length that is less than the configured minimum length after having the check character excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verificationoption is enabled and the minimum length is set to 4 , Interleaved 2 of 5 barcodes with a total length of 4 characters including the check character cannot be read.)

## ITF-14

ITF-14 is a special kind of Interleaved 2 of 5 with a length of 14 characters and the last character as the check character.
ITF-14 priority principle: Forthe Interleaved 2 of 5 barcodes with a length of 14 characters and the last character as the check character, the ITF-14 configurations shall take precedence over the Interleaved 2 of 5 settings.

## Restore Factory Defaults

Restore the Factory Defaults of ITF-14

## Enable/Disable ITF-14

Enable ITF-14 But Do Not Transmit Check Character

Enable ITF-14 and Transmit Check Character

An example of the ITF-14 priority principle: when ITF-14 is enabled and Interleaved 2 of 5 is disabled, the scanner only decodes Interleaved 2 of 5 barcodes with a length of 14 characters and the last character as the check character

## ITF-6

ITF-6 is a special kind of Interleaved 2 of 5 with a length of 6 characters and the last character as the check character.
ITF-6 priority principle: For the Interleaved 2 of 5 barcodes with a length of 6 characters and the last character as the check character, the ITF-6 configurations shall take precedence over the Interleaved 2 of 5 settings.

## Restore Factory Defaults

Restore the Factory Defaults of ITF-6

## Enable/Disable ITF-6

** Disable ITF-6

Enable ITF-6 But Do Not Transmit Check Character

Enable ITF-6 and Transmit Check Character

An example of the ITF-6 priority principle: when ITF-6 is enabled and Interleaved 2 of 5 is disabled, the scanner only decodes Interleaved 2 of 5 barcodes with a length of 6 characters and the last character as the check character.

## Matrix 2 of 5

## Restore Factory Defaults

Restore the Factory Defaults of Matrix 2 of 5

## Enable/Disable Matrix 2 of 5

Disable Matrix 2 of 5

If the scanner fails to identify Matrix 2 of 5 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Matrix 2 of 5 barcode.

## Set Length Range for Matrix 2 of 5

The scanner can be configured to only decode Matrix 2 of 5 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

Set the Minimum Length (Default: 4)

Set the Maximum Length (Default: 80)

If minimum length is set to be greater than maximum length, the scanner only decodes Matrix 2 of 5 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Matrix 2 of 5 barcodes with that length are to be decoded.

Set the scanner to decode Matrix 2 of 5 barcodes containing between 8 and12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

A check character is optional for Matrix 2 of 5 and can be added as the last character. It is a calculated value used to verify the integrity of the data.

■ Disable: The scanner transmitsMatrix 2 of 5 barcodes as is.

■ Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Matrix 2 of 5 bavodes to verify that the data complies with the check character algorithm. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.

- Transmit Check Character After Verification: The scanner checks the integrity of all Matrix 2 of 5 barcodes to vefthat the data complies with the check character algorithm. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Since Matrix 2 of 5 must always have an even number of digits, a zero may need to be added as the first digit when the check character is added. The check character is automatically generated when making Matrix 2 of 5 barcodes.

Do Not Transmit Check Character After Verification

## Transmit Check Character After Verification

If the Do Not Transmit Check Character After Verification option is enabled, Matrix 2 of 5 barcodes with a length that is less than the configured minimum length after having the check character excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verification option is enabled and the minimum length is set to 4 , Matrix 2 of 5 barcodes with a total length of 4 characters including the check character cannot be read.)

## Code 39

## Restore Factory Defaults

Restore the Factory Defaults of Code 39

## Enable/Disable Code 39

Disable Code 39

If the scanner fails to identify Code 39 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Code 39 barcode

## Set Length Range for Code 39

The scanner can be configured to only decode Code 39 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes Code 39 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 39 barcodes with that length are to be decoded.

## Set the scanner to decode Code 39 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

A check character is optional for Code 39 and can be added as the last character. It is a calculated value used to verify the integrity of the data.

- Disable: The scanner transmitsCode 39 barcodes as is.
- Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Code 39 barcodes to verify that the data complies with the check character algorithm. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.
- Transmit Check Character After Verification: The scanner checks the integrity of all Code 39 barcodes to verify tathe data complies with the check character algorithm. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Do Not Transmit Check Character After Verification

[^5]If the Do Not Transmit Check Character After Verification option is enabled, Code 39 barcodes with a length that is less than the configured minimum length after having the check character excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verification option is enabled and the minimum length is set to 4 , Code 39 barcodes with a total length of 4 characters including the check character cannot be read.)

## Transmit Start/Stop Character

Code 39 uses an asterisk (*) for both the start and the stop characters. You can choose whether or not to transmit the start/stop characters by scanning the appropriate barcode below.

** Do Not Transmit Start/Stop Character

Transmit Start/Stop Character

## Enable/Disable Code 39 Full ASCII

The scanner can be configured to identify all ASCII characters by scanning the appropriate barcode below.

[^6]

Enable Code 39 Full ASCII

Enter Setup

## Enable/Disable Code 32 (Italian Pharma Code)

Code 32 is a variant of Code 39 used by the Italian pharmaceutical industry. Scan the appropriate bar code below to enable or disable Code 32 . Code 39 must be enabled and Code 39 check character verification must be disabled for this parameter to function.

Enable Code 32

## Code 32 Prefix

Scan the appropriate barcode below to enable or disable adding the prefix character " A " to all Code 32 barcodes. Code 32 must be enabled for this parameter to function.

** Disable Code 32 Prefix

Enable Code 32 Prefix

Transmit Code 32 Start/Stop Character
Code 32 must be enabled for this parameter to function.

** Do Not Transmit Code 32 Start/Stop Character

## Transmit Code 32 Check Character

** Do Not Transmit Code 32 Check Character

Transmit Code 32 Check Character

## Codabar

## Restore Factory Defaults

Restore the Factory Defaults of Codabar

## Enable/Disable Codabar

Disable Codabar

If the scanner fails to identify Codabar barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Codabar barcode.

## Set Length Range for Codabar

The scanner can be configured to only decode Codabar barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 2)

Set the Maximum Length (Default: 60)

If minimum length is set to be greater than maximum length, the scanner only decodes Codabar barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Codabar barcodes with that length are to be decoded.

Set the scanner to decode Codabar barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

A check character is optional for Codabar and can be added as the last character. It is a calculated value used to verify the integrity of the data.

■ Disable: The scanner transmits Codabar barcodes as is.

■ Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Codabar barcodes to verify that the data complies with the check character algorithm. Barcodes passing the check will be transmitted except the last digit, whereas those failing it will not be transmitted.

■ Transmit Check Character After Verification: The scanner checks the integrity of all Codabar barcodes to vefy that the data complies with the check character algorithm. Barcodes passing the check will be transmitted, whereas those failing it will not be transmitted.

Do Not Transmit Check Character After Verification

## Transmit Check Character After Verification

If the Do Not Transmit Check Character After Verification option is enabled, Codabar barcodes with a length that is less than the configured minimum length after having the check character excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verification option is enabled and the minimum length is set to 4 , Codabar barcodes with a total length of 4 characters including the check character cannot be read.)

## Start/Stop Character

You can set the start/stop characters and choose whether or not to transmit the start/stop characters by scanning the appropriate barcode below.

## Transmit Start/Stop Character

** ABCD/ABCD as the Start/Stop Character

ABCD/TN*E as the Start/Stop Character

abcd/abcd as the Start/Stop Character

abcd/tn*e as the Start/Stop Character

## Code 93

## Restore Factory Defaults

Restore the Factory Defaults of Code 93

## Enable/Disable Code 93

** Disable Code 93

If the scanner fails to identify Code 93 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Code 93 barcode.

## Set Length Range for Code 93

The scanner can be configured to only decode Code 93 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes Code 93 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 93 barcodes with that length are to be decoded.

Set the scanner to decode Code 93 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

Check characters are optional for Code 93 and can be added as the last two characters, which are calculated values used to verify the integrity of the data.

■ Disable: The scanner transmits Code 93 barcodes as is.

■ Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Code 93 barcodes to verify that the data complies with the check character algorithm. Barcodes passing the checks will be transmitted except the last two digits, whereas those failing them will not be transmitted.

■ Transmit Check Character After Verification: The scanner checks the integrity of all Code 93 barcodes to verify tathe data complies with the check character algorithm. Barcodes passing the checks will be transmitted, whereas those failing them will not be transmitted.

## Transmit Check Character After Verification

If the Do Not Transmit Check Character After Verification option is enabled, Code 93 barcodes with a length that is less than the configured minimum length after having the two check characters excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verification option is enabled and the minimum length is set to 4 , Code 93 barcodes with a total length of 4 characters including the two check characters cannot be read.)

barcode and then Enable Plessey barcode.

## Set Length Range for Plessey

The scanner can be configured to only decode Plessey barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. Toaccomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 4)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes Plessey barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Plessey barcodes with that length are to be decoded.

Set the scanner to decode Plessey barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

Check characters are optional for Plessey and can be added as the last two characters, which are calculated values used to verify the integrity of the data.

■ Disable: The scanner transmits Plessey barcodes as is.

■ Do Not Transmit Check Character After Verification: The scanner checks the integrity of all Plessey barcodes to verify that the data complies with the check character algorithm. Barcodes passing the checks will be transmitted except the last two digits, whereas those failing them will not be transmitted.

- Transmit Check Character After Verification: The scanner checks the integrity of all Plessey barcodes to verify tathe data complies with the check character algorithm. Barcodes passing the checks will be transmitted, whereas those failing them will not be transmitted.

Do Not Transmit Check Character After Verification

Transmit Check Character After Verification

If the Do Not Transmit Check Character After Verification option is enabled, Plessey barcodes with a length that is less than the configured minimum length after having the check characters excluded will not be decoded. (For example, when the Do Not Transmit Check Character After Verification option is enabled and the minimum length is set to 4 , Plessey barcodes with a total length of 4 characters including the check characters cannot be read.)

## MSI-Plessey

## Restore Factory Defaults

Restore the Factory Defaults of MSI-Plessey

Enable/Disable MSI-Plessey

** Disable MSI-Plessey

If the scanner fails to identify MSI-Plessey barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable MSI-Plessey barcode.

## Set Length Range for MSI-Plessey

The scanner can be configured to only decode MSI-Plessey barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. Toaccomplish it, you need to set the minimum and maximum lengths.

Set the Minimum Length (Default: 4)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes MSI-Plessey barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only MSI-Plessey barcodes with that length are to be decoded.

Set the scanner to decode MSI-Plessey barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Check Character Verification

Check characters are optional for MSI-Plessey and can be added as the last one or two characters, which are calculated values used to verify the integrity of the data.

If the Disable option is enabled, the scanner transmits MSI-Plessey barcodes as is.

** One Check Character, MOD10

Two Check Characters, M0D10/M0D10

Two Check Characters, MOD10/MOD11

## Transmit Check Character

** Transmit MSI-Plessey Check Character

Do Not Transmit MSI-Plessey Check Character

If you select a check character algorithm and the Do Not Transmit Check Character option, MSI-Plessey barcodes with a length that is less than the configured minimum length after having the check character(s) excluded will not be decoded. (For example, when the One Check Character, M0D10 and Do Not Transmit Check Character options are enabled and the minimum length is set to 4, MSI-Plessey barcodes with a total length of 4 characters including the check character cannot be read.)

AIM 128

## Restore Factory Defaults

Restore the Factory Defaults of AIM 128

## Enable/Disable AIM 128

If the scanner fails to identify AIM 128 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable AIM 128 barcode.

## Set Length Range for AIM 128

The scanner can be configured to only decode AIM 128 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 48)

If minimum length is set to be greater than maximum length, the scanner only decodes AIM 128 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only AIM 128 barcodes with that length are to be decoded.

Set the scanner to decode AIM 128 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

ISBT 128

## Restore Factory Defaults

Restore the Factory Defaults of ISBT 128

Enable/Disable ISBT 128

Enable ISBT 128

** Disable ISBT 128

If the scanner fails to identify ISBT 128 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable ISBT 128 barcode.

## Code 49

## Restore Factory Defaults

Restore the Factory Defaults of Code 49

Enable/Disable Code 49

Enable Code 49

** Disable Code 49

If the scanner fails to identify Code 49 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Code 49 barcode.

## Set Length Range for Code 49

The scanner can be configured to only decode Code 49 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 80)

If minimum length is set to be greater than maximum length, the scanner only decodes Code 49 barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 49 barcodes with that length are to be decoded.

Set the scanner to decode Code 49 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## Code 16K

## Restore Factory Defaults

Restore the Factory Defaults of Code 16K

Enable/Disable Code 16K

## Enable Code 16K

** Disable Code 16K

If the scanner fails to identify Code 16K barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable Code 16K barcode.

## Set Length Range for Code 16K

The scanner can be configured to only decode Code 16 K barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 80)

If minimum length is set to be greater than maximum length, the scanner only decodes Code 16 K barcodes with either the minimum or maximum length. If minimum length is same as maximum length, only Code 16 K barcodes with that length are to be decoded.

Set the scanner to decode Code 16 K barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## PDF417

## Restore Factory Defaults

Restore the Factory Defaults of PDF417

## Enable/Disable PDF417

Disable PDF417

If the scanner fails to identify PDF417 barcodes, you may first try this solution by scanning the Enter Setup barcode and then Enable PDF417 barcode.

## Set Length Range for PDF417

The scanner can be configured to only decode PDF417 barcodes with lengths that fall between (inclusive) the minimum and maximum lengths. To accomplish it, you need to set the minimum and maximum lengths.

## Set the Minimum Length (Default: 1)

Set the Maximum Length (Default: 2710)

Minimum length is not allowed to be greater than maximum length. If you only want to read PDF417 barcodes with a specific length, set both minimum and maximum lengths to be that desired length.

## Set the scanner to decode PDF417 barcodes containing between 8 and 12 characters:

1. Scan the Enter Setup barcode.
2. Scan the Set the Minimum Length barcode.
3. Scan the numeric barcode " 8 " from the "Digit Barcodes" section inAppendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Set the Maximum Length barcode.
6. Scan the numeric barcodes " 1 " and " 2 " from the "Digit Barcodes" section in Appendix.
7. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
8. Scan the Exit Setup barcode.

## PDF417 Twin Code

PDF417 twin code is 2 PDF417 barcodes paralleled vertically or horizontally. They must both be either regular or inverse barcodes. They must have similar specifications and be placed closely together.

There are 3 options for reading PDF417 twin codes:

■ Single PDF417 Only: Read either PDF417 code.

■ Twin PDF417 Only: Read both PDF417 codes.
■ Both Single \& Twin: Read both PDF417 codes. If successful, transmit as twin PDF417 only. Otherwise, try single PDF417 only.

Twin PDF417 Only

## PDF417 Inverse

Regular barcode: Dark bars on a bright background.

Setup barcode and then Enable Passport OCR barcode.

## Chapter 6 Data Formatter

## Introduction

You may use the Data Formatter to modify the scanner's output. For example, you can use the Data Formatter to insert characters at certain points in barcode data or to suppress/replace/ send certain characters in barcode data as it is scanned.

Normally, when you scan a barcode, it gets outputted automatically; however, when you create a format, you must use a "send" command (see the "Send Commands" section in this chapter) within the format programming to output data. The maximum size of formatter commands in a data format is 500 characters. By default, the data formatter is disabled. Enable it when required. If you have changed data format settings, and wish to clear all formats and return to the factory defaults, scan the Default Data Format code below.

Default Data Format

## Add a Data Format

Data format is used to edit barcode data only. You can program up to four data formats, i.e. Format_0, Format_1, Format_2 and Format_3. When you create a data format, you must specify the application scope of your data format (such as barcode type and data length) and include formatter commands. When scanned data does not match your data format requirements, you will hear the non-match error beep (if the non-match error beep is ON).

There are two methods to program a data format: Programming with barcodes and programming with serial commands.

## Programming with Barcodes

The following explains how to program a data format by scanning the specific barcodes. Scanning any irrelevant barcode or failing to follow the setting procedure will result in programming failure. To find the alphanumeric barcodes needed to create a data format, see the "Digit Barcodes" section in Appendix.

Step 1: Scan the Enter Setup barcode.

Step 2: Scan the Add Data Format barcode.

Step 3: Select data format.
Scan a numeric barcode $\mathbf{0}$ or $\mathbf{1}$ or $\mathbf{2}$ or $\mathbf{3}$ to set this to Format_0 or Format_1 or Format_2 or Format_3.
Step 4: Select formatter command type.
Specify what type of formatter commands will be used. Scan a numeric barcode " 6 " to select formatter command type 6. (See the "Formatter Command Type 6" section in this chapter for more information)

Step 5: Set interface type
Scan 999 for any interface type.
Step 6: Set Symbology ID Number
Refer to the "Symbology ID Number" section in Appendix and find the ID number of the symbology to which you want to apply the data format. Scan three numeric barcodes for the symbology ID number. If you wish to create a data format for all symbologies, scan 999.

Step 7: Set barcode data length
Specify what length of data will be acceptable for this symbology. Scan the four numeric barcodes that represent the data length. 9999 is a universal number, indicating all lengths. For example, 32 characters should be entered as 0032 .

Step 8: Enter formatter command
Refer to the "Formatter Command Type 6" section in this chapter. Scan the alphanumeric barcodes that represent the command you need to edit data. For example, when a command is F141, you should scan F141. A command can contain up to 500 characters.

Step 9: Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix to save your data format.

Example: Program format_0 using formatter command type 6, Code 128 containing 10 characters applicable, send all characters followed by "A".

1. Scan the Enter Setup barcode
2. Scan the Add Data Format barcode
3. Scan the $\mathbf{0}$ barcode
4. Scan the $\mathbf{6}$ barcode
5. Scan the $\mathbf{9}$ barcode three times
6. Scan the barcodes 002
7. Scan the barcodes 0010
8. Scan the alphanumeric barcodes F141
9. Scan the Save barcode

Enter the Setup mode
Add a data format
Select format_0
Select formatter command type 6
All interface types applicable
Only Code 128 applicable
Only a length of 10 characters applicable
Send all characters followed by "A" (HEX: 41)
Save the data format

To streamline the programming process, you may as well generate a batch barcode by inputting the command (e.g. @DFMSET069990020010F141;) used to create a data format. See the "Use Batch Barcode" section in Chapter 9 to learn how to put a batch barcode into use.

## Programming with Serial Commands

A data format can also be created by serial commands (HEX) sent from the host device. All commands must be entered in uppercase letters.

The syntax consists of the following elements:
Prefix: "~<SOH>0000" (HEX: 7E 01303030 30), 6 characters.
Storage type: "@" (HEX: 40) or "\#" (HEX: 23), 1 character. "@" means permanent setting which will not be lost by removing power from the scanner or rebooting it; "\#" means temporary setting which will be lost by removing power from the scanner or rebooting it.

Add Data Format Command: "DFMSET" (HEX: 4446 4D 5345 54), 6 character.
Data format: " 0 " (HEX: 30) or " 1 " (HEX: 31) or " 2 " (HEX: 32) or " 3 " (HEX: 33), 1 character. " 0 ", " 1 ", " 2 " and " 3 " represent Format_0, Format_1, Format_2 and Format_3 respectively.

Formatter command type: " 6 " (HEX: 36), 1 character.
Interface type: "999" (HEX: 3939 39), 3 characters.
Symbology ID Number: The ID number of the symbology to which you want to apply the data format, 3 characters. 999 indicates all symbologies.

Data length: The length of data that will be acceptable for this symbology, 4 characters. 9999 indicates all lengths. For example, 32 characters should be entered as 0032 .

Formatter commands: The command string used to edit data, max. 116 characters. For more information, see the "Formatter Command Type 6 " section in this chapter.

Suffix: ";<ETX>" (HEX: 3B 03), 2 characters.

Example: Program format_0 using formatter command type 6, Code 128 containing 10 characters applicable, send all characters followed by "A".

Enter: $\quad$ E 0130303030404446 4D 53455430363939393030333939393946313431 3B03
(~<SOH>0000@DFMSET069990020010F141;<ETX>)

Response: $0201303030304044464 D 5345543036393939303033393939394631343106$ 3B 03
(<STX><SOH>0000@DFMSET069990020010F141<ACK>;<ETX>)

## Enable/Disable Data Formatter

When Data Formatter is disabled, the data format you have enabled becomes invalid.

You may wish to require the data to conform to a data format you have created. The following settings can be applied to your data format:

Enable Data Formatter, Required, Keep Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted along with prefixes and suffixes (if prefix and suffix are enabled). Any data that does not match your data format requirements generates an error beep (if Non-Match Error Beep is turned ON) and the data in that barcode is not transmitted.

Enable Data Formatter, Required, Drop Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted without prefixes and suffixes (even if prefix and suffix are enabled). Any data that does not match your data format requirements generates an error beep (if Non-Match Error Beep is turned ON) and the data in that barcode is not transmitted.

Enable Data Formatter, Not Required, Keep Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted along with prefixes and suffixes (if prefix and suffix are enabled). Barcode data that does not match your data format requirements is transmitted as read along with prefixes and suffixes (if prefix and suffix are enabled).

Enable Data Formatter, Not Required, Drop Prefix/Suffix: Scanned data that meets your data format requirements is modified accordingly and gets outputted without prefixes and suffixes (even if prefix and suffix are enabled). Barcode data that does not match your data format requirements is transmitted as read along with prefixes and suffixes (if prefix and suffix are enabled).

## 

Enable Data Formatter, Required, Keep Prefix/Suffix

Enable Data Formatter, Required, Drop Prefix/Suffix

Enable Data Formatter, Not Required, Keep Prefix/Suffix

Enable Data Formatter, Not Required, Drop Prefix/Suffix

## Non-Match Error Beep

If Non-Match Error Beep is turned ON, the scanner generates an error beep when a barcode is encountered that does not match your required data format.

Non-Match Error Beep Off

## Multiple Data Formats

After the Data Formatter is enabled, you can set the scanner to use one or multiple data formats by scanning the appropriate barcode below.

Multiple Data Formats Off: Only one data format (default: Format_0) is put into use. To learn how to switch to another data format, see the "Data Format Selection" section below.

Multiple Data Formats On: The scanner toggles from Format_0 through Format_3 until scanned data matches the requirements of one data format. If no match is found, the scanner generates an error beep (if Non-Match Error Beep is turned ON ) and the data is not transmitted.

** Multiple Formats Off

## Data Format Selection

You can select a data format you want to use by scanning the appropriate barcode below. Note that this setting is valid only when the Multiple Data Formats feature is turned off.

Format_1

Format_3

Enter Setup

## Change Data Format for a Single Scan

You can switch between data formats for a single scan. The next barcode is scanned using the data format selected here, then reverts to the format you have selected above. This setting is valid only when the Multiple Data Formats feature is turned off.

For example, you may have set your scanner to use the data format you saved as Format_3. You can switch to Format_1 for a single trigger pull by scanning the Single Scan - Format_1 barcode below. The next barcode that is scanned uses Format_1, then reverts back to Format_3.

Note: This setting will be lost by removing power from the scanner, or turning off/ rebooting the device.

Single Scan - Format_2

## Clear Data Format

There are two methods to remove data format created from your scanner:
Delete one data format: Scan the Clear One barcode, a numeric barcode (0-3) and the Save barcode. For example, to delete Format_2, you should scan the Clear One barcode, the $\mathbf{2}$ barcode and the Save barcode

Delete all data formats: Scan the Clear All barcode.

Clear All

## Query Data Formats

You may scan the appropriate barcode below to get the information of data format(s) created by you or preset by manufacturer. For instance, if you have added Format_0 as per the example in the "Add a Data Format" section in this chapter, scanning the Query Current Data Formats barcode, you will get the result: Data Format0:069990020010F141;

## Query Current Data Formats

## Formatter Command Type 6

When working with the Data Formatter, a virtual cursor is moved along your input data string. The following commandsare used to both move this cursor to different positions, and to select, replace, and insert data into the final output. For the hex value of ASCII characters involved in the commands, refer to the "ASCII Table" in Appendix.

## Send Commands

F1 Send all characters

Syntax=F1xx (xx: The insert character's hex value)
Include in the output message all of the characters from the input message, starting from current cursor position, followed by an insert character.

## F2 Send a number of characters

Syntax=F2nnxx (nn: The numeric value (00-99) for the number of characters; xx : The insert character's hex value)
Include in the output message a number of characters followed by an insert character. Start from the current cursor position and continue for " $n n$ " characters or through the last character in the input message, followed by character "xx."

## F2 Example: Send a number of characters

Send the first 10 characters from the barcode above, followed by a carriage return.

Command string: F2100D

F2 is the "Send a number of characters" command

10 is the number of characters to send
$0 D$ is the hex value for a $C R$

The data is output as: $\mathbf{1 2 3 4 5 6 7 8 9 0}$
<CR>

## F3 Send all characters up to a particular character

Syntax=F3ssxx (ss: The particular character's hex value; xx: The insert character's hex value)

Include in the output message all characters from the input message, starting with the character at the current cursor position and continuing to, but not including, the particular character "ss," followed by character "xx." The cursor is moved forward to the "ss" character.

F3 Example: Send all characters up to a particular character $||||||||||||||||||||||||||||||||||||||||||||||||||||||\mid$

Using the barcode above, send all characters up to but not including "D," followed by a carriage return.

Command string: F3440D
F3 is the "Send all characters up to a particular character" command

44 is the hex value for a " D "

0 D is the hex value for a $C R$

The data is output as: $\mathbf{1 2 3 4 5 6 7 8 9 0 A B C}$
<CR>

## E9 Send all but the last characters

Syntax=E9nn (nn: The numeric value (00-99) for the number of characters that will not be sent at the end of the message)
Include in the output message all but the last "nn" characters, starting from the current cursor position. The cursor is moved forward to one position past the last input message character included.

## F4 Insert a character multiple times

Syntax=F4xxnn (xx: The insert character's hex value; nn: The numeric value (00-99) for the number of times it should be sent)
Send "xx" character " nn " times in the output message, leaving the cursor in the current position.

## E9 and F4 Example: Send all but the last characters, followed by 2 tabs <br> 

Send all characters except for the last 8 from the barcode above, followed by 2 tabs.

Command string: E908F40902

E9 is the "Send all but the last characters" command 08
is the number of characters at the end to ignore F4 is
the "Insert a character multiple times" command 09 is
the hex value for a horizontal tab

02 is the number of time the tab character is sent

The data is output as: $\mathbf{1 2 3 4 5 6 7 8 9 0} \mathbf{A B}<$ tab><tab>

## B3 Insert symbology name

Insert the name of the barcode's symbology in the output message, without moving the cursor.

## B4 Insert barcode length

Insert the barcode's length in the output message, without moving the cursor. The length is expressed as a numeric string and does not include leading zeros.

## B3 and B4 Example: Insert the symbology name and length

Send the symbology name and length before the barcode data from the barcode above. Break up these insertions with spaces.
End with a carriage return

Command string: B3F42001B4F42001F10D

B3 is the "Insert symbology name" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of time the space character is sent

B4 is the "Insert barcode length" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of time the space character is sent

F1 is the "Send all characters" command

0 D is the hex value for a CR

The data is output as: Code128 20 1234567890ABCDEFGHIJ
<CR>

## Move Commands

F5 Move the cursor forward a number of characters

Syntax=F5nn (nn: The numeric value (00-99) for the number of characters the cursor should be moved ahead)

Move the cursor ahead " nn " characters from current cursor position.

## F5 Example: Move the cursor forward and send the data

##  1234567890ABCDEFGHIJ

Move the cursor forward 3 characters, then send the rest of the barcode data from the barcode above. End with a carriage return.

Command string: F503F10D

F5 is the "Move the cursor forward a number of characters" command

03 is the number of characters to move the cursor

F1 is the "Send all characters" command

0 D is the hex value for a CR

The data is output as: 4567890ABCDEFGHIJ
<CR>

F6 Move the cursor backward a number of characters

Syntax=F6nn (nn: The numeric value (00-99) for the number of characters the cursor should be moved back)

Move the cursor back "nn" characters from current cursor position.

F7 Move the cursor to the beginning
Syntax $=$ F7
Move the cursor to the first character in the input message.

## EA Move the cursor to the end

Syntax $=E A$

Move the cursor to the last character in the input message.

## Search Commands

## F8 Search forward for a character

Syntax $=$ F8xx (xx: The search character's hex value)
Search the input message forward for "xx" character from the current cursor position, leaving the cursor pointing to the "xx" character.

F8 Example: Send barcode data that starts after a particular character

Search for the letter "D" in barcodes and send all the data that follows, including the "D". Using the barcode above:

Command string: F844F10D
F8 is the "Search forward for a character" command

44 is the hex value for " $D$ "

F1 is the "Send all characters" command

0 D is the hex value for a CR

The data is output as: DEFGHIJ
<CR>

## F9 Search backward for a character

Syntax $=\mathrm{F9xx}(\mathrm{xx}:$ The search character's hex value)
Search the input message backward for " xx " character from the current cursor position, leaving the cursor pointing to the " xx " character.

## B0 Search forward for a string

Syntax=B0nnnnS (nnnn: The string length (up to 9999); S: The ASCII hex value of each character in the string)

Search forward for " S " string from the current cursor position, leaving cursor pointing to " S " string. For example, B0000454657374 will search forward for the first occurrence of the 4-character string "Test."

B0 Example: Send barcode data that starts after a string of characters

Search for the letters "FGH" in barcodes and send all the data that follows, including "FGH." Using the barcode above:

Command string: B00003464748F10D

B0 is the "Search forward for a string" command

0003 is the string length (3 characters)

46 is the hex value for " F "

47 is the hex value for " G "

48 is the hex value for " H "

F1 is the "Send all characters" command

0 D is the hex value for a CR

The data is output as: FGHIJ
<CR>

## B1 Search backward for a string

Syntax $=$ B1nnnnS (nnnn: The string length (up to 9999); S: The ASCII hex value of each character in the string)

Search backward for " S " string from the current cursor position, leaving cursor pointing to " S " string. For example, B1000454657374 will search backward for the first occurrence of the 4 -character string "Test."

## E6 Search forward for a non-matching character

Syntax=E6xx (xx: The search character's hexvalue)

Search the input message forward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character.

E6 Example: Remove zeros at the beginning of barcode data

This example shows a barcode that has been zero filled. You may want to ignore the zeros and send all the data that follows. E6 searches forward for the first character that is not zero, then sends all the data after, followed by a carriage return. Using the barcode above:

Command string: E630F10D
E6 is the "Search forward for a non-matching character" command

30 is the hex value for 0

F1 is the "Send all characters" command
$0 D$ is the hex value for a $C R$

The data is output as: $\mathbf{3 7 6 9 2}$
<CR>

## E7 Search backward for a non-matching character

Syntax $=$ E7xx (xx: The search character's hex value)
Search the input message backward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character.

## Miscellaneous Commands

## FB Suppress characters

Syntax $=$ FBnnxxyy..zz (nn: The numeric value (00-15) for the number of suppressed characters; xxyy..zz: The hex value of the characters to be suppressed)

Suppress all occurrences of up to 15 different characters, starting at the current cursor position, as the cursor is advanced by other commands.

## FB Example: Remove spaces in barcode data

This example shows a barcode that has spaces in the data. You may want to remove the spaces before sending the data. Using the barcode above

Command string: FB0120F10D
FB is the "Suppress characters" command

01 is the number of the characters to be suppressed

20 is the hex value for a space

F1 is the "Send all characters" command

0 D is the hex value for a $C R$

The data is output as: $\mathbf{3 4 5 6 7 8 9 0}$
<CR>

## E4 Replace characters

Syntax $=\mathrm{E}_{4} n n x x_{1} \mathrm{xx}_{2} \mathrm{yy}_{1} \mathrm{yy}_{2} \ldots \mathrm{zz}_{1} \mathrm{Zz}_{2}(\mathrm{nn}$ : The total count of the number of characters (characters to be replaced plus replacement characters; $\mathrm{xx}_{1}$ : The characters to be replaced, $\mathrm{xx}_{2}$ : The replacement characters, continuing through $\mathrm{zz}_{1}$ and $\mathrm{zZ}_{2}$ )

Replace up to 15 characters in the output message, without moving the cursor.

## E4 Example: Replace zeros with CRs in barcode data

 1234056780 ABC

If the barcode has characters that the host application does not want included, you can use the E4 command to replace those characters with something else. In this example, you will replace the zeros in the barcode above with carriage returns.

Command string: E402300DF10D

E4 is the "Replace characters" command

02 is the total count of characters to be replaced, plus the replacement characters ( 0 is replaced by $C R$, so total characters=2) 30 is the hex value for 0
$0 D$ is the hex value for a CR (the character that will replace the 0 ) F1
is the "Send all characters" command

0D is the hex value for a CR

The data is output as: 1234
5678
ABC
<CR>

## BA Replace a string with another

Syntax $=\mathrm{BAnnNN}_{1} \mathrm{SS}_{1} \mathrm{NN}_{2} \mathrm{SS}_{2}$
nn : The count of replacements to be made, if $\mathrm{nn}=00$ or $\mathrm{nn}>=$ the number of occurrences of a string to be replaced, then replace all occurrences of that string.
$\mathrm{NN}_{1}$ : The length of the string to be replaced, $\mathrm{NN}_{1}>0$.
$\mathrm{SS}_{1}$ : The ASCII hex value of each character in the string to be replaced.
$\mathrm{NN}_{2}$ : The length of replacement string, $\mathrm{NN}_{2}>=0$. To replace string " $\mathrm{SS}_{1}$ " with NUL (i.e. delete string " $\mathrm{SS}_{1}$ "), you should set $\mathrm{NN}_{2}$ to 00 and leave out $\mathrm{SS}_{2}$.
$\mathrm{SS}_{2}$ : The ASCII hex value of each character in the replacement string.

From the current cursor position, search forward for the occurrence of " $\mathrm{SS}_{1}$ " string (of length " $\mathrm{NN}_{1}$ ") and replace the string with " $\mathrm{SS}_{2}$ " string (of length " $\mathrm{NN}_{2}$ ") in the output message until every " $\mathrm{SS}_{1}$ " stringis replaced or the count of replacements made reaches " $n n$ " times, without moving the cursor.

## BA Example: Replace " 23 "s with "ABC"s in barcode data

## cd123abc23bc12ab232

If the barcode has a string of characters that the host application does not want included, you can use the BA command to replace the string with something else. In this example, you will replace the " 23 "s in the barcode above with " ABC "s.

Command string: BA0002323303414243F100

BA is the "Replace a string with another" command

00 is the count of replacements to be made, 00 means to replace all occurrences of that string 02
is the length of the string to be replaced

32 is the hex value for 2 (character in the string to be replaced)

33 is the hex value for 3 (character in the string to be replaced)

03 is the length of the replacement string

41 is the hex value for A (character in the replacement string)

42 is the hex value for B (character in the replacement string)

43 is the hex value for C (character in the replacement string)

F1 is the "Send all characters" command

00 is the hex value for a NUL

The data is output as: cd1ABCabcABCbc12abABC2

## BA Example: Remove only the first occurrence of " 23 " $s$ in barcode data

If the barcode has a string of characters that the host application wants removed, you can use the BA command to replace the string with NUL. In this example, you will remove the first occurrence of " 23 " in the barcode above.

Command string: BA0102323300F100

BA is the "Replace a string with another" command

01 is the count of replacements to be made

02 is the length of the string to be replaced

32 is the hex value for 2 (character in the string to be replaced)

33 is the hex value for 3 (character in the string to be replaced)

00 is the length of the replacement string, 00 means to replace the string to be replaced with NUL F1
is the "Send all characters" command

00 is the hex value for a NUL

The data is output as: cd1abc23bc12ab232

## EF Insert a delay

Syntax $=$ EFnnnn (nnnn: The delay in 5 ms increments, up to 9999)
Inserts a delay of up to 49,995 milliseconds (in multiples of 5), starting from the current cursor position. This command can only be used with USB HID Keyboard.

EF Example: Insert a delay of 1 s between the $5^{\text {th }}$ and $6^{\text {th }}$ character
Send the first 5 characters in a barcode, wait for 1 s , then send the rest of the barcode data.
Command string: F20500EF0200E900
F2 is the "Send a number of characters" command
05 is the number of characters to send
00 is the hex value for a Null character
EF is the "Insert a delay" command
0200 is the delay value ( $5 \mathrm{msX200}=1000 \mathrm{~ms}=1 \mathrm{~s}$ )
$E 9$ is the "Send all but the last characters" command
00 is the number of characters that will not be sent at the end of the message

## B5 Insert key strokes

Syntax=B5nnssxx (nn: The number of keys pressed (without key modifiers); ss: the key modifier from the table below; xx : the key number from the "Unicode Key Maps" in Appendix.)

Insert a key stroke or combination of key strokes. Key strokes are dependent on your keyboard (see the "Unicode Key Maps" in Appendix). This command can only be used with USB HID Keyboard.

| Key Modifiers |  |
| :--- | :--- |
| No Key Modifier | 00 |
| Shift Left | 01 |
| Shift Right | 02 |
| Alt Left | 04 |
| Alt Right | 08 |
| Control Left | 10 |
| Control Right | 20 |

For example, B501001F inserts an "a" on a U.S. style keyboard. B5 $=$ the command, $01=$ number of keys pressed (without the key modifier), 00 is No Key Modifier, and 1F is the "a" key. If an " A " were to be inserted, B501011F or B501021F would be entered.

If there are two keystrokes, the syntax would change from Syntax=B5nnssxx for one keystroke to Syntax=B5nnssxxssxx. An example that would insert " aA " is as follows: B502001F011F.

Note: Key modifiers can be added together when needed. Example: Shift Left + Alt Left + Control Left =15.

## Chapter 7 Prefix \& Suffix

## Introduction

#### Abstract

A 1D barcode could contain digits, letters, symbols, etc. A 2D barcode could contain more data, such as Chinese characters and other multi-byte characters. However, in real applications, they do not and should not have all information we need, such as barcode type, data acquisition time and delimiter, in order to keep the barcodes short andflexible.

Preffix and suffix are how to fulfill the needs mentioned above. They can be added, removed and modified while the original barcode data remains intact.

Barcode processing procedure:

1. Edit data with Data Formatter
2. Append prefix/suffix
3. Pack data
4. Append terminating character

## Global Settings

## Enable/Disable All Prefixes/Suffixes

Disable All Prefixes/Suffixes: Transmit barcode data with no prefix/suffix.
Enable All Prefixes/Suffixes: Allow to append Code ID prefix, AIM ID prefix, custom prefix/suffix and terminating character to the barcode data before the transmission.

Enable All Prefixes/Suffixes

## Prefix Sequence

Custom + Code ID + AIM ID

## Custom Prefix

## Enable/Disable Custom Prefix

If custom prefix is enabled, you are allowed to append to the data a user-defined prefix that cannot exceed 10 characters. For example, if the custom prefix is " AB " and the barcode data is " 123 ", the Host will receive "AB123".

Enable Custom Prefix

## Set Custom Prefix

To set a custom prefix, scan the Set Custom Prefix barcode then the numeric barcodes corresponding to the hexadecimal value of a desired prefix then the Save barcode.

Note: A custom prefix cannot exceed 10 characters.

Set Custom Prefix

Set the custom prefix to "CODE" (HEX: 0x43/0x4F/0x44/0x45):

1. Scan the Enter Setup barcode.
2. Scan the Set Custom Prefix barcode.
3. Scan the numeric barcodes " 4 ", " 3 ", " 4 ", " $F$ ", " 4 ", " 4 ", " 4 " and " 5 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Enable Custom Prefix barcode.
6. Scan the Exit Setup barcode.

## AIM ID Prefix

AIM (Automatic Identification Manufacturers) ID defines symbology identifier (For the details, see the "AIM ID Table" section in Appendix). If AIM ID prefix is enabled, the scanner will add the symbology identifier before the scanned data after decoding.

AIM ID is not user programmable.

## Code ID Prefix

Code ID can also be used to identify barcode type. Unlike AIM ID, Code ID is user programmable. Code ID can only consist of one or two English letters.

## Restore All Default Code IDs

For the information of default Code IDs, see the "Code ID Table" section in Appendix.

Restore All Default Code IDs

## Modify Code ID

See the examples below to learn how to modify a Code ID and restore the default Code IDs of all symbologies.
 <br> \title{
Modify PDF417 Code ID to be "p" (HEX: 0x70): <br> \title{
Modify PDF417 Code ID to be "p" (HEX: 0x70): <br> 1. Scan the Enter Setup barcode. <br> 2. Scan the Modify PDF417 Code ID barcode. <br> 3. Scan the numeric barcodes " 7 " and " 0 " from the "Digit Barcodes" section in Appendix. <br> 4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix. <br> 5. Scan the Exit Setup barcode.
}

## Restore the default Code IDs of all symbologies:

1. Scan the Enter Setup barcode.
2. Scan the Restore All Default Code IDs barcode.
3. Scan the Exit Setup barcode.

1D symbologies:

Modify Code 128 Code ID

Modify EAN-8 Code ID

Modify UPC-E Code ID

Modify Interleaved 2 of 5 Code ID

Modify Code 39 Code ID

Modify Code 93 Code ID

Modify AIM 128 Code ID

Modify Industrial 25 Code ID

Modify Plessey Code ID

Modify Code 11 Code ID

Modify MSI-Plessy Code ID

@CID031
Modify GS1 Databar Code ID

@CID133
Modify Code 16K Code ID

2D symbologies:

Modify Data Matrix Code ID

Modify Maxicode Code ID

Modify Chinese Sensible Code ID

Modify GM Code ID

Modify Micro QR Code ID

Modify Code One Code ID

## Postal symbologies:

Modify USPS Postnet Code ID

Modify USPS Inteligent Mail Code ID

Modify Royal Mail Code ID

Modify KIX Post Code ID

Modify Australian Postal Code ID

## Custom Suffix

## Enable/Disable Custom Suffix

If custom suffix is enabled, you are allowed to append to the data a user-defined suffix that cannot exceed 10 characters. For example, if the custom suffix is "AB" and the barcode data is " 123 ", the Host will receive " 123 AB ".

Enable Custom Suffix

## Set Custom Suffix

To set a custom suffix, scan the Set Custom Suffix barcode then the numeric barcodes corresponding to the hexadecimal value of a desired suffix then the Save barcode.

Note: A custom suffix cannot exceed 10 characters.

Set Custom Suffix

Set the custom suffix to "CODE" (HEX: 0x43/0x4F/0x44/0x45):

1. Scan the Enter Setup barcode.
2. Scan the Set Custom Suffix barcode.
3. Scan the numeric barcodes " 4 ", " 3 ", " 4 ", " $F$ ", " 4 ", " 4 ", " 4 " and " 5 " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Enable Custom Suffix barcode.
6. Scan the Exit Setup barcode.

## Data Packing

## Introduction

Data packing is designed for a specific group of users who want to have the data packed before transmission. Data packing influences data format, so it is advised to disable this feature when it is not required.

## Data Packing Options

$\checkmark$ Disable Data Packing: Transmit decoded data in raw format (unpacketed).
$\checkmark$ Enable Data Packing, Format 1: Transmit decoded data with the packet format 1 defined below.
Packet format 1: [STX + ATTR + LEN] + [AL_TYPE + DATA] + [LRC] STX:
0x02

ATTR: 0x00
LEN: Barcode data length is expressed in 2 bytes ranging from 0x0000 (0) to 0xFFFF (65535).
AL_TYPE: 0x36
DATA: Raw barcode data.
LRC: Check digit.

$\curvearrowright$ Enable Data Packing, Format 2: Transmit decoded data with the packet format 2 defined below.
Packet format 2: [STX + ATTR + LEN] + [AL_TYPE] + [Symbology_ID + DATA] + [LRC] STX:
0x02
ATTR: 0x00

LEN: Barcode data length is expressed in 2 bytes ranging from $0 \times 0000$ ( 0 ) to 0xFFFF (65535). AL_TYPE:

0x3B
Symbology_ID: The ID number of symbology, 1 byte.
DATA: Raw barcode data.
LRC: Check digit.
LRC calculation algorithm: computation sequence: $0 x F F+$ LEN+AL_TYPE+Symbology_ID+DATA; computation method is XOR, byte by byte.

Enable Data Packing, Format 2

## Terminating Character Suffix

## Enable/Disable Terminating Character Suffix

A terminating character such as carriage return (CR) or carriage return/line feed pair (CRLF) can only be used to mark the end of data, which means nothing can be added after it.

** Disable Terminating Character Suffix

Enable Terminating Character Suffix

## Set Terminating Character Suffix

To set a terminating character suffix, scan the Set Terminating Character Suffix barcode then the numeric barcodes corresponding to the hexadecimal value of a desired terminating character then the Save barcode.

Note: A terminating character suffix cannot exceed 2 characters.

Set Terminating Character Suffix

Set Terminating Character to CR (0x0D)

## Set the terminating character suffix to $0 \times 0 \mathrm{~A}$ :

1. Scan the Enter Setup barcode.
2. Scan the Set Terminating Character Suffix barcode.
3. Scan the numeric barcodes " 0 " and " $A$ " from the "Digit Barcodes" section in Appendix.
4. Scan the Save barcode from the "Save/Cancel Barcodes" section in Appendix.
5. Scan the Enable Terminating Character Suffix barcode.
6. Scan the Exit Setup barcode.

## Chapter 8 Batch Programming

## Introduction

Batch programming enables users to integrate a batch of commands into a single batch barcode.

Listed below are batch programming rules:

1. Command format: Command + Parameter Value.
2. Each command is terminated by a semicolon (;). Note that there is no space between a command and its terminator semicolon.
3. Use the barcode generator software to generate a 2D batch barcode.

Example: Create a batch barcode for Illumination Always On, Sense Mode, Decode Session Timeout $=2 \mathrm{~s}$ :

1. Input the commands:
@ILLSCN2;SCNMOD2;ORTSET2000;
2. Generate a batch barcode.

When setting up a scanner with the above configuration, scan the Enable Batch Barcode barcode and then the batch barcode generated.

Enable Batch Barcode

## Create a Batch Command

A batch command may contain a number of individual commands each of which is terminated by a semicolon (;). For more information, refer to the Serial Programming Command Manual.

## Create a Batch Barcode

Batch barcodes can be produced in the format of PDF417, QR Code or Data Matrix.
Example: Create a batch barcode for Illumination Always On, Sense Mode, Decode Session Timeout $=2 \mathrm{~s}$ :

1. Input the following commands:
@ILLSCN2;SCNMOD2;ORTSET2000;
2. Generate a PDF417 batch barcode.

## Use Batch Barcode

To put a batch barcode into use, scan the following barcodes. (Use the example above.)

Enter Setup

Enable Batch Barcode

## Save/Cancel Barcodes

After reading numeric barcode(s), you need to scan the Save barcode to save the data. If you scan the wrong digit(s), you can either scan the Cancel barcode and then start the configuration all over again, or scan the Delete the Last Digit barcode and then the correct digit, or scan the Delete All Digits barcode and then the digits you want.

For instance, after reading the Maximum Length barcode and numeric barcodes " 1 ", " 2 " and " 3 ", you scan:
■ Delete the Last Digit: The last digit " 3 " will be removed.
■ Delete All Digits: All digits " 123 " will be removed.

- Cancel: The maximum length configuration will be cancelled. And the scanner is still in the setup mode.

Delete the Last Digit

## Factory Defaults Table

| Parameter | Factory Default | Remark |
| :---: | :---: | :---: |
| System Settings |  |  |
| Barcode Programming | Disabled (Exit Setup) |  |
| Programming Barcode Data | Do not transmit |  |
| Illumination | Normal |  |
| Aiming | Normal |  |
| Good Read LED | On |  |
| Good Read LED Duration | Short (20ms) |  |
| Power On Beep | On |  |
| Good Read Beep | On |  |
| Good Read Beep Duration | Medium (80ms) |  |
| Good Read Beep Frequency | Medium (2730Hz) |  |
| Good Read Beep Volume | Loud |  |
| Scan Mode | Sense Mode |  |
| Decode Session Timeout | $3,000 \mathrm{~ms}$. | 1-3,600,000ms; 0: Infinite |
| Image Stabilization Timeout (Sense Mode) | 200 ms | $0-3,000 \mathrm{~ms}$ |
| Timeout between Decodes (Same Barcode) | Disabled |  |
|  | 1,500ms | 0-3,600,000ms |
| Sensitivity | Medium Sensitivity |  |
| Trigger Commands | Disabled |  |
| Scanning Preference | Normal Mode |  |
| Decode Area | Whole Area Decoding |  |
| Specify Decoding Area | 40\% top, $60 \%$ bottom, $40 \%$ left, $60 \%$ right |  |
